Data Type: a data type or simply type is a classification identifying one of various types of data, such as real-valued, integer or Boolean, that determines the possible values for that type; the operations that can be done on values of that type; the meaning of the data; and the way values of that type can be stored. Data Structure: a data structure is a particular way of storing and organizing data in a computer so that it can be used efficiently.

Knowing what problem a data structure is trying to solve and breaking it down to its basic elements makes it much easier to implement it and especially to remember what the data structure is about and when it can be used. All you have to " memorize " is its definitions and properties – which are easier to remember if you think about what it is trying to solve.
