Deploy and Run Spring boot with MySQL application in Docker and Docker Compose Docker for Data Science: Deploying a Web Application Docker Up Running

Running docker-compose up -d starts the containers in the background and leaves them running. If there are existing containers for a service, and the service's configuration or image was changed after the container's creation, docker-compose up picks up the changes by stopping and recreating the containers (preserving mounted volumes).

docker-compose up | Docker Documentation

When working with Docker, software developers mostly use the 'docker run' command to: Create a container from a given docker image Run a container with an optional name Run a container in the foreground Run a container in the detached mode Run a container in interactive mode Publish container ports ...

The docker run command first creates a writeable container layer over the specified image, and then starts it using the specified command. That is, docker run is equivalent to the API /containers/create then /containers/ (id)/start. A stopped container can be restarted with all its previous changes intact using docker start.

docker run | Docker Documentation

Docker Desktop. The preferred choice for millions of developers that are building containerized apps. Docker Desktop is an application for MacOS and Windows machines for the building and sharing of containerized applications. Access Docker Desktop and follow the guided onboarding to build your first containerized application in minutes.

It is worthwhile, whether now or in the near future, to familiarize yourself with the Docker... Building ¶. The Docker Compose file tells Docker ...

Vapor: Deploy ? Docker
Docker compose, formerly known as Fig, is a tool which can define and run complex applications using Docker. Basically it does the job of creating multiple containers and links between them. Using Docker Compose requires defining the environment required for your app using a Dockerfile and the services required for the app in a '.yml' file.

How to Build and Run your apps using Docker Compose
Enter http://localhost:5000/ in a browser to see the application running. If you're using Docker natively on Linux, Docker Desktop for Mac, or Docker Desktop for Windows, then the web app should now be listening on port 5000 on your Docker daemon host. Point your web browser to http://localhost:5000 to find the Hello World message. If this doesn't resolve, you can also try http://127.0.0.1:5000.

Get started with Docker Compose | Docker Documentation
Running the below bash code consistently breaks access to Docker from WSL2. Is that expected? If so, what is the best way to get Docker up and running again? running=$(docker ps -q) if ["${running}" != ""]; then echo "Stopping running ...

Docker Desktop. The preferred choice for millions of developers that are building containerized apps. Docker Desktop is a tool for MacOS and Windows machines for the building and sharing of containerized applications and microservices. Access Docker Desktop and follow the guided onboarding to build your first containerized application in minutes.

Empowering App Development for Developers | Docker
Docker Compose has an -f flag where you can pass in the location of the docker-compose.yml file (or a custom file if you happen to name it something different). That means you could run: docker-compose -f /tmp/myproject/docker-compose.yml up -d from anywhere on your file system and things will work. I use this a lot in my scripts.
