This volume provides a comprehensive overview for investigating biology at the level of individual cells. Chapters are organized into eight parts detailing a single-cell lab, single cell DNA-seq, RNA-seq, single cell proteomic and epigenetic, single cell multi-omics, single cell screening, and single cell live imaging. Written in the highly successful Methods in Molecular Biology series format, chapters include introductions to their respective topics, lists of the necessary materials and reagents, step-by-step, readily reproducible laboratory protocols, and tips on troubleshooting and avoiding known pitfalls. Authoritative and cutting-edge, Single Cell Methods: Sequencing and Proteomics aims to make each experiment easily reproducible in every lab.

This book summarizes the recent progress in the physics and astrophysics of neutron stars and, most importantly, it identifies and develops effective strategies to explore, both theoretically and observationally, the many remaining open questions in the field. Because of its significance in the solution of many fundamental questions in nuclear physics, astrophysics and gravitational physics, the study of neutron stars has seen enormous progress over the last years and has been very successful in improving our understanding in these fascinating compact objects. The book addresses a wide spectrum of readers, from students to senior researchers. Thirteen chapters written by internationally renowned experts offer a thorough overview of the various facets of this interdisciplinary science, from neutron star formation in supernovae, pulsars, equations of state super dense matter, gravitational wave emission, to alternative theories of gravity. The book was initiated by the European Cooperation in Science and Technology (COST) Action MPI1304 "Exploring fundamental physics with compact stars" (NewCompStar).

The theoretical study of the nuclear equation of state (EOS) is a field of research which deals with most of the fundamental problems of nuclear physics. This book gives an overview of the present status of the microscopic theory of the nuclear EOS. Its aim is essentially twofold: first, to serve as a textbook for students entering the field, by covering the different subjects as exhaustively and didactically as possible; second, to be a reference book for all researchers active in the theory of nuclear matter, by providing a report on the latest developments. Special emphasis is given to the numerous open problems existing at present and the prospects for their possible solutions. The general framework of the different approaches presented in the book is the meson theory of nuclear forces — where no free parameter is introduced — and the many-body treatment of nucleon-nucleon correlations. The ultimate hope of this world-wide effort is the understanding of the structure of nuclear matter, both in the ground state and at finite temperature. The main audience addressed is the community of theoretical nuclear physicists, but nuclear experimentalists and astrophysicists will also find in the book an extensive amount of material of direct interest for their everyday work, particularly for those studying heavy-ion collisions, where the nuclear EOS is of special relevance. Finally, theoretical physicists working on elementary particle theory could find in the book some stimulating ideas and problems directly related to their field. Contents:The Many-Body Theory of the Nuclear Equation of State (M Baldo)The Dirac-Brueckner Approach (R Brockmann & R Machleidt)The Dirac-Brueckner Approach for Finite Nuclei (H Mütter)Non-Nucleonic Degrees of Freedom (L S Ferreira)Long-Range Correlations in Nuclear Matter (T S Kuo et al.)The Mass Operator and the Brueckner-Bethe-Goldstone Method (R Sartor)The Nucleon Propagator in Nuclear Medium (W H Dickhoff)Neutron Stars' Structure and Nuclear Equation of State (I Bombaci)Superfluidity in Nuclear Matter (U Lombardo). Master this technique with everything from felting basics to fabulous clothing to décor projects. There's something magical about felting knits: You start with a piece of fabric that looks and feels a certain way and, by exposing it to water and agitation, finish with one that looks and feels completely different. This fascinating transformation is what led author Leigh Radford to begin felting years ago, and has kept her intrigued by the process ever since. Now, in AlterKnits Felt, Radford pushes the boundaries of traditional felting, as she did with traditional knitting in her earlier book, AlterKnits. Through 30 colorful, vibrant projects, she shows readers how to knit and then felt their own handiwork, as well as how to create gorgeous felted objects from recycled knits and uspun fiber. An introductory chapter on felting basics explains everything you need to know to make the fabulous clothes, accessories, and home décor that follow. The projects range from a quick and easy circle coin purse, to a shibori bag, to a reverse-appliqué rug, each unusual in its own way, distinguished by a special surface texture, an innovative mix of techniques, or a quirky combination of yarns. AlterKnits Felt provides every crafter with the tools to explore—and expand—the art of felting.

Volume 2 of Novel Superfluids continues the presentation of recent results on superfluids, including novel metallic systems, superfluid liquids, and atomic/molecular gases of bosons and fermions. The phenomenon of superfluidity remains one of the most important topics in physics. Again and again, novel superfluids yield surprising and interesting behaviors. The many classes of metallic superconductors continue to offer challenges. The technical applications grow steadily. What the temperature and field limits are remains illusive. Atomic nuclei, neutron stars and the Universe itself all involve various aspects of superfluidity, and the lessons learned have had a broad impact on physics as a whole.
