A lamella clarifier or inclined plate settler is a type of settler designed to remove Particulates from liquids. They are often employed in primary water treatment in place of conventional settling tanks. They are used in Industrial water treatment. Unlike conventional clarifiers they use a series of inclined plates. These inclined plates provide a large effective settling area for a small footprint. The inlet stream is stilled upon entry into the clarifier. Solid particles begin to settle on th

The robust design comes from the heavy duty construction of the tank, sludge hopper and inclined plate pack. The wide density of inclined plates are specifically designed for no short circuiting causing the need for maintenance. The feed ports are also designed for creating an optimum ratio between the clarification and thickening area.

Wastewater treatment plants should be designed so that the effluent standards and reuse objectives, and biosolids regulations can be met with reasonable ease and cost. The design should incorporate flexibility for dealing with seasonal changes, as well as long-term changes in wastewater quality and future regulations. Good planning and design, therefore, must be based on five major steps: characterization of the raw wastewater quality and effluent, pre-design studies to develop alternative processes and selection of final process train, detailed design of the selected alternative, contraction, and operation and maintenance of the completed facility. Engineers, scientists, and
