ISO/TS 16732:2005 provides the conceptual basis for fire risk assessment by stating the principles underlying the quantification and interpretation of fire-related risk. These fire risk principles apply to all fire-related phenomena and all end-use configurations, which means these principles can be applied to all types of fire scenarios.

ISO 16232-3:2007 describes the principles of extraction of contaminants from a component by pressure rinsing. It is preferably applied to components of which the surface to be examined is accessible by a jet of test liquid. This method can be employed on its own or in association with other methods of extraction described in the ISO 16232 series.
