Natural Convection - Free

Convection In general, convection is either the mass transfer or the heat transfer due to bulk movement of molecules within fluids such as gases and liquids. Although liquids and gases are generally not very good conductors of heat, they can transfer heat quite rapidly by convection.

Natural Convection - Free Convection - Nuclear Power

Natural convection heat transfer is extensively used in the following areas of engineering: 1. Cooling of commercial high voltage electrical power transformers. 2. Heating of houses by electrical baseboard heaters. 3. Heat loss from steam pipe lines in power plants and heat gain in refrigerant pipe lines in air conditioning applications. 4.

Convective Heat Transfer - Engineering ToolBox

Natural convection is a type of flow, of motion of a liquid such as water or a gas such as air, in which the fluid motion is not generated by any external source but by some parts of the fluid being heavier than other parts. The driving force for natural convection is gravity. For example if there is a layer of cold dense air on top of hotter less dense air, gravity pulls more strongly on the denser layer on top, so it falls while the hotter less dense air rises to take its place. This creates c

Natural convection is a method of heat transfer in which natural means influence the motion of the fluid. There is no influence from external facts. This movement of molecules in the fluid is due to the differences between densities of different regions of the same fluid. The density of a fluid decreases when it heats and vice versa.

Hao Du et al. investigated the convection heat transfer dissipation of porous copper plates under both forced and natural conditions. Three samples were tested with different porosity under unsteady heat dissipation. They found that the forced convection dissipated heat about 5–6 times higher than the natural convection.

Natural convection or free convection refers to heat transfer by currents caused either directly by gravitational forces or by density differences between the cold and warm spots in a liquid or gas. The formation of natural convection currents can be seen, for example, when water is heated in a pot.
