[Although Schroeder says we 're not supposed to use the word "temperature" in the explanation, clearly what we 're doing is decreasing the temperature of B and increasing that of A until the temperatures are equal. The slope $\partial S = \partial U$ is just another way of referring to the temperature.]

Thermodynamic identity (Schroeder 3.4) $dU = TdS - pdV$ (1.5) Total differential

When we have a total differential, the things in front of the dS, dV , etc are partial derivatives. $T = \left(\frac{\partial U}{\partial S}\right)_V - p = \left(\frac{\partial U}{\partial V}\right)_S$ (1.6) Also, you can integrate along a path using a total differential, and can do linear algebra using total differential equations, e.g. substituting one for another.

Most universities use Thermal Physics by Schroeder. I ' m not a fan of this book because there are no solutions and there are no example problems. I tried finding another thermal physics book that I really liked and this was really difficult. I had to go through 5+ textbooks and finally found two that were worth while.

Schroeder An Introduction To Thermal Physics

Zero-point energy (ZPE) is the lowest possible energy that a quantum mechanical system may have. Unlike in classical mechanics, quantum systems constantly fluctuate in their lowest energy state as described by the Heisenberg uncertainty principle. As well as atoms and molecules, the empty space of the vacuum has these properties. According to quantum field theory, the universe can be thought ...
