Village Savings and Loan Associations (VSLAs) provide poor people in remote, rural areas with a safe place to store small amounts, and in doing so to build up a fund from which small, flexible loans can be taken by the members. These independent associations operate in areas that standard microfinance programs cannot reach due to high costs and have proved successful in more than 30 countries worldwide. They work without long-term technical support and injections of donor capital.Thirty years since the start of the microfinance revolution, poor people who live in many rural areas and urban slums still find it difficult to access appropriate microfinance products, even in countries with a well-developed microfinance sector. VSLAs based in the community are complementary to MFIs tending to serve the very poor whose income is less reliable, but also offering useful services to the economically secure.This manual offers a set of tools that will enable any organization, whether or not it has experience with microfinance, to set up and run successful VSLAs. It sets out a one-year program of VSLA formation, training and supervision, and includes guidance on approaches to impact evaluation and the use of a simple Management Information System to analyze field officers and overall program performance.

Everywhere in the world, small agricultural producers are entrepreneurs, traders, investors, and consumers, all rolled into one. In all these roles, small agricultural households constantly seek to use available financial instruments to improve their productivity and secure the best possible consumption and investment choices for their families. But the package of financial services available to small farmers in developing countries is severely limited, especially for those living in remote areas with no access to basic market infrastructure. When poor people have limited saving or borrowing options, their investment plans are stifled and it becomes harder for them to break out of poverty. If households have no access to insurance and are unable to accumulate small savings that enable them to pay for household and business expenses, especially during lean seasons, they are forced to limit their exposure to risk, even if high returns are expected, once again making the pathway out of poverty more arduous than necessary. Inadequate access to financial services is thus part of what is often called the "poverty trap."

Communities around the world rely on forests for their livelihoods, and the sustainable development of small-scale, often family-run enterprises is increasingly recognised as a key to poverty reduction. This publication examines the needs of such small-scale enterprises for access to microfinance services, given the seasonal and often unpredictable nature of forest-based activities. It looks at different types of financial institutions (such as banks, non-governmental organisations, co-operatives and credit unions) as well as group lending, leasing, insurance and cash transfers. The strengths and weaknesses of different approaches are considered through four case studies which draw on experiences in Nepal, Guatemala, the Sudan and Peru.
